DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Art Unit: 1764

Claims 1-8, 10-16, and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Marland et al (WO 99/37737) in view of Benham et al (US Patent 5,620,670).

Claims 1-4 and 11-14.

Marland invention discloses a low temperature or high temperature Fischer Tropsch (FT) process using a fixed or slurry catalyst bed (Page 1, lines 15-17; page 2, lines 1-17). The invention further discloses, "The hard wax may thus be a wax produced by the FT synthesis process, from which lighter fraction has been removed". (Page 2, lines 17-19). Marland also discloses in the Example that 59% hydrocarbons with C₄₉+ in the feed convert to 24%hydrocarbons with C₄₉+ in the product (Page 7, lines 23-25; page 8, lines 1-8). It means that the cracking conversion is 59.3%. Marland invention discloses, "A process for treating a wax, which process includes thermally cracking, in a cracking stage, a feed wax having a congealing point X°C, to produce, as a primary product, a lighter wax having a congealing point Y°C, where X>Y." (Page 1, lines 4-7). Marland further discloses in the figure, cracked products from cracker (18) being cooled in the cooler (24) and separated in the distillation column (28), thereby giving overhead product (30) and low pour point wax (32).

Marland discloses products of FT synthesis and collecting FT wax but does not disclose collecting FT condensate.

Art Unit: 1764

Benham invention discloses FT condensate (Figure 3) from the distillation column (120).

Since Marland and Benham inventions are using FT synthesis under similar conditions producing similar products, it would have been obvious to one skilled in the art at the time the invention was made to combine Marland and Benham inventions and take a portion of the condensate from Benham device and blend with the lighter wax of Marland process to reduce the viscosity of the wax. Also, sine Marland discloses the congealing point or temperature, Y, of the lighter wax in the range of 60°C to 90°C (Page 4, lines 11-13), it would have been obvious to one skilled in the art at the time the invention was made to modify Marland invention and take a portion of the overhead light products (stream 30) to blend with the lighter wax (32) to produce a product with pour point of about 40°C for use in the lubricants.

Claims 5, 15 and 16.

Although Marland does not disclose the pour point but it does disclose the congealing point or temperature, Y, of the lighter wax in the range of 60-90°C (Page 4, lines 11-13). Thus, it would have been obvious to one skilled in the art to modify Marland invention and determine the pour point which is an equivalent parameter to express the flow characteristics of the wax.

Art Unit: 1764

Claim 6.

Marland invention discloses, "In the distillation column (28), the wax product is separated into light hydrocarbon fraction, which includes the inert gas, and leaves along the overhead withdrawal line (30)." (Page 7, lines 11-14).

Marland does not specifically mention about separation of light products in stream (30). But it would have been obvious to one skilled in the art at the time the invention was made to modify Marland invention and separate the components into C_5 + and C_4 - products and use the C_5 + as a blending component as mentioned under claim 1 to make use of the light stream otherwise going to waste and make the process more economical.

Claims 7 and 8.

Marland does not disclose recycle of C₄- hydrocarbon products and a reformer.

Although Benham invention does not disclose the cracking of wax (figure 3), it would have been obvious to one skilled in the art to combine Marland and Benham inventions and take wax from Benham (figure 3) and crack in the cracker disclosed in Marland to recycle the light gases from distillation column to the FT reactor (110). Figure 3 of Benham invention also shows light hydrocarbon gases from distillation column and the figure of Marland invention also shows light hydrocarbon gases from distillation column (30). Although Marland and Benham inventions do not specifically mention about methane, but it is known to those skilled in the art that methane is one of the components of the light hydrocarbon gases. Benham invention (figure 3) clearly

Art Unit: 1764

shows recycle of light hydrocarbon gases (i.e., methane) recycle (stream 138) to the reformer (105).

Claims 9 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Marland et al (WO 99/37737) in view of Benham et al (US Patent 5,620,670) and further in view of Richter et al (US Patent 6,315,891).

<u>Claims 9 and 17.</u>

Marland and Benham inventions do not disclose blending petroleum-derived crude in the FT waxy product.

Richter invention discloses, "A process for producing a waxy product, which process comprises hydrotreating a feedstock comprising a FT wax and a petroleumbased waxy distillate." (Column 1, lines 8-14). Richter shows in Tables 1 and 2 the ASTM distillation characteristics of FT wax and petroleum based waxy distillate respectively (Column 1, lines 35-45, lines 56-66). It can be observed that the FT wax has lower initial and final boiling point compared to the petroleum based distillate.

Since Marland, Benham, and Richter inventions teach a similar process of producing a FT wax, it would have been obvious to one skilled in the art at the time the invention was made to combine the teachings of Marland, Benham, and Richter and blend petroleum derived crude oil in the FT waxy product to reduce the initial and final boiling points of the finished waxy product.

<u>Claims 10 and 18</u>.

Marland discloses that the process is used to convert a hard wax, particularly a FT derived hard wax to a lighter wax (Page 11, lines 5-8). Marland also discloses that the congealing point of the hard wax is above 90°c (Page 1, lines 10-12) and congealing point of the lighter wax is in the range of 60-90°C (Page 4, lines 11-13). Thus, it would have been obvious to one skilled in the art at the time the invention was made to modify the Marland invention and specify the reduced viscosity of the lighter wax than the hard wax because "lighter" and "lower congealing point" are equivalent to the "reduced viscosity".

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Perciful, US Patent 4,042,488.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Prem C. Singh whose telephone number is 571-272-6381. The examiner can normally be reached on MF 6:30 AM-3:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Glenn Caldarola can be reached on 571-272-1444. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
